

Display File Path

v3.2

Universal, for macOS 11+/Music v1.1+
Find more free AppleScripts
and info on writing your own
at dougscripts.com.

This script will float alongside the Music app and continuously monitor it for a single track to be selected and display that track's file path (if it exists); or the script can be set to likewise display the file path of each playing track. Includes Show in Finder and Copy Path to Clipboard options.

Universal, for macOS 11 and later only.

This script is [Donationware](#). If you use it and like it please consider making a donation to support my AppleScripting efforts. [Click here](#) for more info.

Installation:

This script, "Display File Path", is an **AppleScript applet** and can be run by double-clicking its icon in the Finder. Thus, it can be installed anywhere you find it convenient to access. However, it is probably best accessed from the Script menu of the Music app from where it can be launched by clicking its name.

To make an AppleScript available in **the Music app's** Script menu, install it in the Music "Scripts" folder. This is located at *[user name] / Library / Music / Scripts /*. **Music app** will look for AppleScripts in this folder.

*The user Library directory may be hidden by default. To make it visible, hold down the Option key on your keyboard and select **Go > Library** from the Finder.*

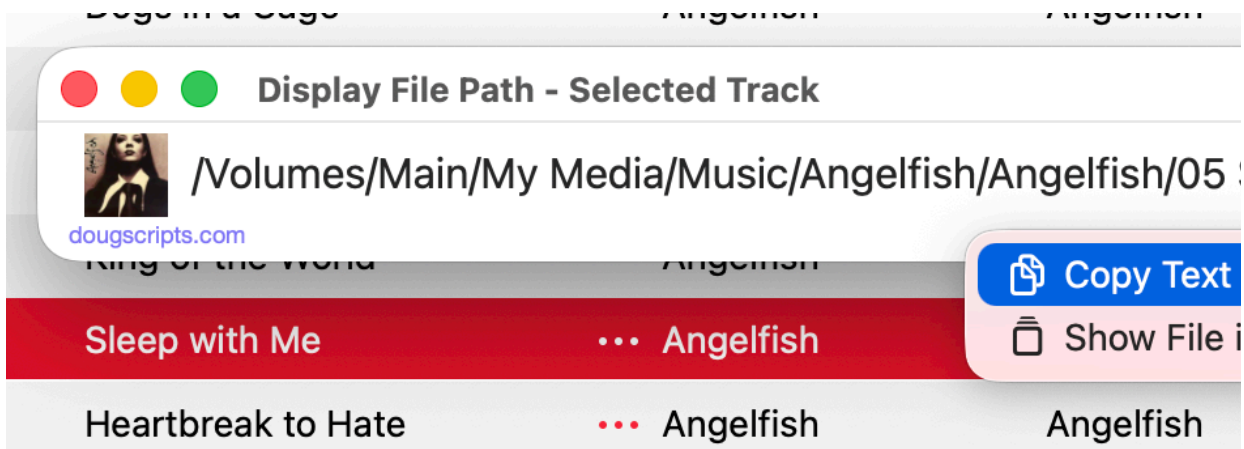

If the *[user name] / Library /* folder does not contain the "Music" folder or "Scripts" folder, then create them and put the script in the "Scripts" folder. AppleScripts will then appear in the Music app's Script menu and can be activated by selecting by name and clicking.

Be sure to also save this Read Me document in a safe and convenient place.

See the online [Download FAQ](#) for more info and video on downloading and installing AppleScripts.

How to use:

Launch the script and this long narrow window will display and stay running alongside the Music app:

The window is re-sizable horizontally. The contextual menu is selected.

Whenever a single track is selected in the Music app and its associated file is accessible, the path to that file will be displayed in the window.

- The window will update whenever any single track is selected. If more than one track or no tracks are selected (or playing, if that option is selected; *see below*) then the display will be blank.
- If a track's local file is not accessible—it's a "dead" track—then the last known location of the file will be displayed and its text will be **colored red**.
- If a track is only available in the cloud, then the word **Cloud** will be displayed in the

window.

Toggle Display Selected or Playing Tracks - [Command-T]

Clicking the script's *File > Display Playing Tracks Only* menu item (or pressing **Command-T**) will toggle whether only single **selected** tracks are monitored or if the **current playing track** is monitored. A checkmark in the menu item signifies the latter. This setting is "remembered" between launchings.

Show in Finder - [Command-L]

If the displayed file path is local and accessible, this command will show the file in the Finder.

Copy - [Command-C]

If a file path is displayed in the window, the file path can be copied **as a text string** to the clipboard by clicking the script's *Edit > Copy* menu item or by pressing the **Command-C** keyboard shortcut while the window is frontmost.

The **Show in Finder** and **Copy Text to Clipboard** commands are also accessible from a contextual menu that can be activated by right-clicking anywhere in the window under the title bar (as seen in the screenshot above).
