

Document Security

Send. Unsend

The screenshot shows the 'Manage' section of the RDACS interface. It features a table of documents with columns for Type, Created (UTC), Subject/Description, Document Name, Initial Readers, Days Since Viewed, Status, and Access Control. The 'Status' column contains buttons for 'Active' (green) and 'Expired' (red). The 'Access Control' column contains buttons for 'Protect Views' (blue), 'Restrict Readers' (red), and 'Control Readers' (orange). A 'Kill Selected' button is visible in the top right of the interface, highlighted by a red dashed box and a callout bubble. Another callout bubble highlights a 'Kill Selected' button in a search results overlay.

Type	Created (UTC)	Subject/Description	Document Name	Initial Readers	Days Since Viewed	Status	Access Control

Whether senders later decide that sensitive document probably shouldn't live a full life out-in-the-ether or in their colleague's inbox; or they realize they accidentally sent sensitive content to the wrong recipient, they have total control of their document. Senders can kill the document – make it self-destruct without trace – or temporarily disable viewing, and more; all after the send.
