

St. Louis electrical contractor installs MaxLite high bays with c-Max™ controls

CASE STUDY

An electrical contractor located in St. Louis, MO replaced their entire warehouse's fluorescent T8 six lamp high bays with MaxLite's BLHE3 Eco High Bays equipped with c-Max Network controls.

Testimonial:

The c-Max Lighting Controls is different than any other system I have seen on the market today. The system eliminates the expense of running separate switch legs, emergency lighting circuits and 0-10V dimming completely. All lights are simply powered hot and all switching and dimming are controlled wirelessly through the app, daylight harvesting sensors, motion detectors or wireless switches. The system does not require a "Factory Certified" programmer to make changes to the system. Anyone with Admin privileges and a smart phone can easily change the programming on the lights without an instruction manual next to them. Once the lights are linked to the App they create a mesh network throughout the space so there are no nodes or control modules or internet connections required for the system to operate properly. The App allows the customers to move lights in and out of designated groups or scenes to control switching zones, linkage settings between multiple lights, dimming and daylight harvesting eliminating the cost of rewiring fixtures. Any customer that is looking for a system that is versatile, easy to use and saves on construction cost should look into the c-Max Lighting Controls for their building.
